java.math

Class BigInteger

```
java.lang.Object
  java.lang.Number
    java.math.BigInteger
```

All Implemented Interfaces:

[Serializable](#), [Comparable<BigInteger>](#)

```
public class BigInteger
  extends Number
  implements Comparable<BigInteger>
```

Immutable arbitrary-precision integers. All operations behave as if `BigInteger`s were represented in two's-complement notation (like Java's primitive integer types). `BigInteger` provides analogues to all of Java's primitive integer operators, and all relevant methods from `java.lang.Math`. Additionally, `BigInteger` provides operations for modular arithmetic, GCD calculation, primality testing, prime generation, bit manipulation, and a few other miscellaneous operations.

Semantics of arithmetic operations exactly mimic those of Java's integer arithmetic operators, as defined in *The Java Language Specification*. For example, division by zero throws an `ArithmeticException`, and division of a negative by a positive yields a negative (or zero) remainder. All of the details in the Spec concerning overflow are ignored, as `BigInteger`s are made as large as necessary to accommodate the results of an operation.

Semantics of shift operations extend those of Java's shift operators to allow for negative shift distances. A right-shift with a negative shift distance results in a left shift, and vice-versa. The unsigned right shift operator (`>>>`) is omitted, as this operation makes little sense in combination with the "infinite word size" abstraction provided by this class.

Semantics of bitwise logical operations exactly mimic those of Java's bitwise integer operators. The binary operators (`and`, `or`, `xor`) implicitly perform sign extension on the shorter of the two operands prior to performing the operation.

Comparison operations perform signed integer comparisons, analogous to those performed by Java's relational and equality operators.

Modular arithmetic operations are provided to compute residues, perform exponentiation, and compute multiplicative inverses. These methods always return a non-negative result, between 0 and (`modulus - 1`), inclusive.

Bit operations operate on a single bit of the two's-complement representation of their operand. If necessary, the operand is sign-extended so that it contains the designated bit. None of the single-bit operations can produce a `BigInteger` with a different sign from the `BigInteger` being operated on, as they affect only a single bit, and the "infinite word size" abstraction provided by this class ensures that there are infinitely many "virtual sign bits" preceding each `BigInteger`.

For the sake of brevity and clarity, pseudo-code is used throughout the descriptions of `BigInteger` methods. The pseudo-code expression (`i + j`) is shorthand for "a `BigInteger` whose value is that of the `BigInteger` `i` plus that of the `BigInteger` `j`." The pseudo-code expression (`i == j`) is shorthand for "true if and only if the `BigInteger` `i` represents the same value as the `BigInteger` `j`." Other pseudo-code expressions are interpreted similarly.

All methods and constructors in this class throw `NullPointerException` when passed a null object reference for any input parameter.

Since:

JDK1.1

Field Summary

Fields

Modifier and Type	Field and Description
static BigInteger	ONE The BigInteger constant one.
static BigInteger	TEN The BigInteger constant ten.
static BigInteger	ZERO The BigInteger constant zero.

Constructor Summary

Constructors

Constructor and Description
BigInteger (byte[] val) Translates a byte array containing the two's-complement binary representation of a BigInteger into a BigInteger.
BigInteger (int signum, byte[] magnitude) Translates the sign-magnitude representation of a BigInteger into a BigInteger.
BigInteger (int bitLength, int certainty, Random rnd) Constructs a randomly generated positive BigInteger that is probably prime, with the specified bitLength.
BigInteger (int numBits, Random rnd) Constructs a randomly generated BigInteger, uniformly distributed over the range 0 to (2 ^{numBits} - 1), inclusive.
BigInteger (String val) Translates the decimal String representation of a BigInteger into a BigInteger.
BigInteger (String val, int radix) Translates the String representation of a BigInteger in the specified radix into a BigInteger.

Method Summary

Methods

Modifier and Type	Method and Description
BigInteger	abs() Returns a BigInteger whose value is the absolute value of this BigInteger.
BigInteger	add(BigInteger val) Returns a BigInteger whose value is (this + val).
BigInteger	and(BigInteger val) Returns a BigInteger whose value is (this & val).
BigInteger	andNot(BigInteger val) Returns a BigInteger whose value is (this & ~val).
int	bitCount() Returns the number of bits in the two's complement representation of this BigInteger that differ from its sign bit.
int	bitLength() Returns the number of bits in the minimal two's-complement representation of this BigInteger, <i>excluding</i> a sign bit.
BigInteger	clearBit (int n)

Returns a BigInteger whose value is equivalent to this BigInteger with the designated bit cleared.

int

compareTo(**BigInteger** val)

Compares this BigInteger with the specified BigInteger.

BigInteger

divide(**BigInteger** val)

Returns a BigInteger whose value is (this / val).

BigInteger[]

divideAndRemainder(**BigInteger** val)

Returns an array of two BigIntegers containing (this / val) followed by (this % val).

double

doubleValue()

Converts this BigInteger to a double.

boolean

equals(**Object** x)

Compares this BigInteger with the specified Object for equality.

BigInteger

flipBit(int n)

Returns a BigInteger whose value is equivalent to this BigInteger with the designated bit flipped.

float

floatValue()

Converts this BigInteger to a float.

BigInteger

gcd(**BigInteger** val)

Returns a BigInteger whose value is the greatest common divisor of abs(this) and abs(val).

int

getLowestSetBit()

Returns the index of the rightmost (lowest-order) one bit in this BigInteger (the number of zero bits to the right of the rightmost one bit).

int

hashCode()

Returns the hash code for this BigInteger.

int

intValue()

Converts this BigInteger to an int.

boolean

isProbablePrime(int certainty)

Returns true if this BigInteger is probably prime, false if it's definitely composite.

long

longValue()

Converts this BigInteger to a long.

BigInteger

max(**BigInteger** val)

Returns the maximum of this BigInteger and val.

BigInteger

min(**BigInteger** val)

Returns the minimum of this BigInteger and val.

BigInteger

mod(**BigInteger** m)

Returns a BigInteger whose value is (this mod m).

BigInteger

modInverse(**BigInteger** m)

Returns a BigInteger whose value is (this⁻¹ mod m).

BigInteger

modPow(**BigInteger** exponent, **BigInteger** m)

Returns a BigInteger whose value is (this^{exponent} mod m).

BigInteger

multiply(**BigInteger** val)

Returns a BigInteger whose value is (this * val).

BigInteger

negate()

Returns a BigInteger whose value is (-this).

BigInteger

nextProbablePrime()

Returns the first integer greater than this BigInteger that is probably prime.

BigInteger

not()

Returns a BigInteger whose value is (~this).

BigInteger

or(**BigInteger** val)

Returns a BigInteger whose value is (this | val).

BigInteger

pow(int exponent)

	Returns a BigInteger whose value is <code>(this^{exponent})</code> .
static BigInteger	probablePrime (int bitLength, Random rnd) Returns a positive BigInteger that is probably prime, with the specified bitLength.
BigInteger	remainder (BigInteger val) Returns a BigInteger whose value is <code>(this % val)</code> .
BigInteger	setBit (int n) Returns a BigInteger whose value is equivalent to this BigInteger with the designated bit set.
BigInteger	shiftLeft (int n) Returns a BigInteger whose value is <code>(this << n)</code> .
BigInteger	shiftRight (int n) Returns a BigInteger whose value is <code>(this >> n)</code> .
int	signum () Returns the signum function of this BigInteger.
BigInteger	subtract (BigInteger val) Returns a BigInteger whose value is <code>(this - val)</code> .
boolean	testBit (int n) Returns true if and only if the designated bit is set.
byte[]	toByteArray () Returns a byte array containing the two's-complement representation of this BigInteger.
String	toString () Returns the decimal String representation of this BigInteger.
String	toString (int radix) Returns the String representation of this BigInteger in the given radix.
static BigInteger	valueOf (long val) Returns a BigInteger whose value is equal to that of the specified long.
BigInteger	xor (BigInteger val) Returns a BigInteger whose value is <code>(this ^ val)</code> .
